

1	Report 1111 : CT :
3	Ischaemic stroke, deep, recent [select]
4	Ischaemic stroke, deep, old [select]
5	Ischaemic stroke, cortical, recent [<u>yes</u> select]
6	Ischaemic stroke, cortical, old [select]
7	Ischaemic stroke, underspecified [select]
8	Haemorrhagic stroke, deep, recent [select]
9	Haemorrhagic stroke, deep, old [select]
10	Haemorrhagic stroke, lobar, recent [select]
11	Haemorrhagic stroke, lobar, old [select]
12	Haemorrhagic stroke, underspecified [select]
13	Stroke, underspecified [select]
14	Tumour, meningioma [select]
15	Tumour, metastasis [select]
16	Tumour, glioma [select]
17	Tumour, other [select]
18	Small vessel disease [<u>yes</u> select]
19	Atrophy [<u>yes</u> select]
20	Subdural haematoma [select]
21	Subarachnoid haemorrhage, aneurysmal [select]
22	Subarachnoid haemorrhage, other [select]
23	Microbleed, deep [select]
24	Microbleed, lobar [select]
25	Microbleed, underspecified [select]
26	Haemorrhagic transformation [select]
28	CLINICAL HISTORY
30	Clinical details: falls, ?cerebellar infarct, rule out subdural.
32	REPORT
34	Findings: Noncontrast study. No previous CT for comparison. There is increased attenuation seen within the distal left terminal carotid artery and proximal portion of the left <u>loc:cortical</u> middle cerebral artery consistent with <u>time:recent</u> acute thrombus. Subtle sulcal effacement is noted in the left <u>loc:cortical</u> MCA territory, particularly around the peri-Sylvian parenchyma. <u>time:recent</u> <u>loc:cortical</u> Evolving left MCA <u>ischaemic stroke</u> infarction. No <u>time:recent</u> acute <u>haemorrhagic stroke</u> haemorrhage seen. Generalised <u>atrophy</u> atrophy and is evidence of some diffuse low density change within the cerebral white matter which would be in keeping with <u>small vessel disease</u> small vessel cerebrovascular ischaemia.
